

# **Faderfox DJ2 / MIDI Setup for Modul8**

## **Version 1 (c) 2007 [eyetrapp.net/fosfor](http://www.eyetrapp.net/fosfor)**

### **Additional Information**

This manual gives an example how to set up the Faderfox Microcontroller DJ2 for Modul8. There are many more possibilities to map Modul8 controls to the DJ2; you may come up with a totally different approach. You are invited to share your experiences with me and ask questions via <http://www.eyetrapp.net/fosfor> .

In this setup, all controls are assigned to global parameters.

For layer-specific parameters, the LC2 can be combined with a Faderfox LD2 with endless encoders. See reference at <http://www.eyetrapp.net/hardware>

For the top encoders (#1,#2) i have currently no use because of the specific midi signal. Any ideas are welcome!

The colored controls are used for modules. In this proposal:

Yellow: Joystick FX1: Movie Scratch absolute position,  
Joystick FX2: Kaleidoscope X/Y  
lower button for switch FX1/FX2

Pink: Global Mask; lower buttons for quick access of mask settings

Green: Sigma6 M-Cut; Global Shake

Blue: Movie Scratch Speed control

Several buttons are still free. All buttons send „on“ signals when pushed and „off“ when released. This can NOT be changed.

For further reference also check out <http://www.faderfox.de> and the DJ2 manual.
